Intro to DBeaver + SQL (with Chinook DB)

Install → Tour → Basic → Intermediate → Advanced
SQL

Install DBeaver

- 1. Go to `https://dbeaver.io/download`
- 2. Download the Community Edition
- 3. Install with default settings
- 4. Launch DBeaver

Load the Chinook Database

- 1. Download `Chinook_Sqlite.sqlite` from GitHub
- 2. File → New → Database Connection → SQLite
- 3. Choose `Chinook_Sqlite.sqlite` file
- 4. Click Finish

OR use the default install demo DB

DBeaver UI Tour

- • Database Navigator (left)
- SQL Editor (main pane)
- Results Grid (bottom)
- ER Diagram tab (right-click DB)
- New SQL script: Alt+Insert
- Run SQL: Ctrl+Enter

Basic SQL: SELECT & LIMIT

- `SELECT * FROM Album LIMIT 10;`

See first 10 albums

- `SELECT * FROM Artist
WHERE Name = 'Queen';`

- **Find a specific artist**

- `SELECT Name, Milliseconds/60000.0 AS Minutes
FROM Track
WHERE Milliseconds > 300000
ORDER BY Minutes DESC;`

- **Tracks longer than 5 minutes**

What is an INNER JOIN?

- An INNER JOIN returns **only the rows where there's a match in *both* tables.**
- Think of it like a **Venn diagram's overlapping middle** — you only get the part where the two tables intersect.
- If a row exists in Table A but not in Table B, it's **excluded**.
- If a row exists in Table B but not in Table A, it's **excluded** too.
- Useful when you only care about complete data relationships.

```
SELECT Album.Title AS AlbumTitle,  
       Artist.Name AS ArtistName  
FROM Album  
INNER JOIN Artist  
  ON Album.ArtistId = Artist.ArtistId  
ORDER BY ArtistName  
LIMIT 10;
```

```
SELECT Track.Name, Album.Title  
FROM Track  
INNER JOIN Album  
  ON Track.AlbumId = Album.AlbumId;
```

What is a LEFT JOIN?

- A LEFT JOIN (aka **LEFT OUTER JOIN**) returns:
- **All rows from the left table**
- **Matching rows from the right table**
- **NULLs where no match exists on the right**
*If there's no match, it **still shows the left row** — just with blanks from the right side.*

```
SELECT Artist.Name AS ArtistName,  
       Album.Title AS AlbumTitle  
FROM Artist  
LEFT JOIN Album  
  ON Artist.ArtistId = Album.ArtistId  
ORDER BY ArtistName  
LIMIT 15;
```

- Every row from Artist appears.
- If a match exists in Album, its Title is shown.
- If not, AlbumTitle shows NULL.

Aggregate by Country

- ```
SELECT Country, COUNT(*) AS CustomerCount
FROM Customer
GROUP BY Country
ORDER BY CustomerCount DESC
LIMIT 5;
```

# Advanced: Subquery (Longest Track)

```
■ SELECT Name, AlbumId, Milliseconds
FROM Track
WHERE Milliseconds = (
 SELECT MAX(Milliseconds)
 FROM Track t2
 WHERE t2.AlbumId = Track.AlbumId
);
```

# Advanced: CASE Logic

```
■ SELECT Name,
 CASE
 WHEN Milliseconds < 180000 THEN 'Short'
 WHEN Milliseconds < 300000 THEN 'Medium'
 ELSE 'Long'
 END AS LengthCategory
FROM Track;
```

# Advanced: Create a View

```
■ CREATE VIEW TopArtists AS
SELECT Artist.Name, COUNT(Album.AlbumId) AS Albums
FROM Artist
JOIN Album ON Artist.ArtistId = Album.ArtistId
GROUP BY Artist.Name;
```

# Advanced: Query a View

```
■ SELECT * FROM TopArtists
ORDER BY Albums DESC
LIMIT 10;
```

# Advanced: Nested Subquery + JOINS

```
■ SELECT Artist.Name, COUNT(Track.TrackId) AS
TotalTracks
FROM Artist
JOIN Album ON Artist.ArtistId = Album.ArtistId
JOIN Track ON Album.AlbumId = Track.AlbumId
WHERE Artist.ArtistId IN (
 SELECT ArtistId FROM Album WHERE Title LIKE
 '%Greatest%'
)
GROUP BY Artist.Name;
```
